1.1 Definitions

(1) **Angle** : The motion of any revolving line in a plane from its initial position (initial side) to the final position (terminal side) is called angle. The end point \( O \) about which the line rotates is called the vertex of the angle.

(2) **Measure of an angle** : The measure of an angle is the amount of rotation from the initial side to the terminal side.

(3) **Sense of an angle** : The sense of an angle is determined by the direction of rotation of the initial side into the terminal side. The sense of an angle is said to be positive or negative according as the initial side rotates in anticlockwise or clockwise direction to get the terminal side.

(4) **Right angle** : If the revolving ray starting from its initial position to final position describes one quarter of a circle. Then we say that the measure of the angle formed is a right angle.

(5) **Quadrants** : Let \( X'OX \) and \( YOY' \) be two lines at right angles in the plane of the paper. These lines divide the plane of paper into four equal parts. Which are known as quadrants. The lines \( X'OX \) and \( YOY' \) are known as \( x \)-axis and \( y \)-axis. These two lines taken together are known as the co-ordinate axes.

(6) **Angle in standard position** : An angle is said to be in standard position if its vertex coincides with the origin \( O \) and the initial side coincides with \( OX \) i.e., the positive direction of \( x \)-axis.

(7) **Angle in a quadrant** : An angle is said to be in a particular quadrant if the terminal side of the angle in standard position lies in that quadrant.

(8) **Quadrant angle** : An angle is said to be a quadrant angle if the terminal side coincides with one of the axes.
### 1.2 System of Measurement of Angles

There are three systems for measuring angles:

1. **Sexagesimal or English system**: Here a right angle is divided into 90 equal parts known as degrees. Each degree is divided into 60 equal parts called minutes and each minute is further divided into 60 equal parts called seconds. Therefore,
   - 1 right angle = 90 degree (°)
   - 1° = 60 minutes (′)
   - 1′ = 60 seconds (″)

2. **Centesimal or French system**: It is also known as French system, here a right angle is divided into 100 equal parts called grades and each grade is divided into 100 equal parts, called minutes and each minute is further divided into 100 seconds. Therefore,
   - 1 right angle = 100 grades (′)
   - 1 grade = 100 minutes (″)
   - 1 minute = 100 seconds (″)

3. **Circular system**: In this system the unit of measurement is radian. One radian, written as 1c, is the measure of an angle subtended at the centre of a circle by an arc of length equal to the radius of the circle.

Consider a circle of radius r having centre at O. Let A be a point on the circle. Now cut off an arc AP whose length is equal to the radius r of the circle. Then by the definition the measure of \( \angle AOP \) is 1 radian (1c).

### 1.3 Relation between Three Systems of Measurement of an Angle

Let \( D \) be the number of degrees, \( R \) be the number of radians and \( G \) be the number of grades in an angle \( \theta \).

Now,
- \( 90° = 1 \) right angle \( \Rightarrow 1° = \frac{1}{90} \) right angle
- \( D° = \frac{D}{90} \) right angles \( \Rightarrow \theta = \frac{D}{90} \) right angles \( ........(i) \)

Again,
- \( \pi \) radians = 2 right angles \( \Rightarrow 1 \) radian = \( \frac{2}{\pi} \) right angles
- \( R \) radians = \( \frac{2R}{\pi} \) right angles \( \Rightarrow \theta = \frac{2R}{\pi} \) right angles \( ........(ii) \)

and
- 100 grades = 1 right angle \( \Rightarrow 1 \) grade = \( \frac{1}{100} \) right angle
- \( G \) grades = \( \frac{G}{100} \) right angles \( \Rightarrow \theta = \frac{G}{100} \) right angles \( ........(iii) \)
From (i), (ii) and (iii) we get,
\[
\frac{D}{G} = \frac{2R}{\pi}
\]

This is the required relation between the three systems of measurement of an angle.

\textbf{Note}: One radian = \frac{180^\circ}{\pi} \Rightarrow \pi \text{ radians} = 180^\circ \Rightarrow 1 \text{ radian} = 57^\circ 17' 44.8" \approx 57^\circ 17' 45''.

\section*{1.4 Relation between an Arc and an Angle}

If s is the length of an arc of a circle of radius \(r\), then the angle \(\theta\) (in radians) subtended by this arc at the centre of the circle is given by \(\theta = \frac{s}{r}\) or \(s = r\theta\) i.e., arc = radius \times angle in radians

\textbf{Sectorial area}: Let \(OAB\) be a sector having central angle \(\theta\) and radius \(r\). Then area of the sector \(OAB\) is given by \(\frac{1}{2}r^2\theta\).

\textbf{Important Tips}

\(\text{The angle between two consecutive digits in a clock is } 30^\circ (= \frac{\pi}{6} \text{ radians}). \text{ The hour hand rotates through an angle of } 30^\circ \text{ in one hour.}\)

\(\text{The minute hand rotate through an angle of } 6^\circ \text{ in one minute.}\)

\textbf{Example: 1}  
The circular wire of radius 7 cm is cut and bend again into an arc of a circle of radius 12 cm. The angle subtended by an arc at the centre of the circle is

\(\text{(a) } 50^\circ \qquad \text{(b) } 210^\circ \qquad \text{(c) } 100^\circ \qquad \text{(d) } 60^\circ\)

\textbf{Solution:} (b)  
Given the diameter of circular wire = 14 cm. Therefore length of wire = 14\pi \text{ cm}

Hence, required angle = \frac{\text{Arc}}{\text{Radius}} = \frac{14\pi}{12} = \frac{7\pi}{6} \text{ radian} \Rightarrow \frac{7\pi}{6} \times \frac{180^\circ}{\pi} = 210^\circ.

\textbf{Example: 2}  
The degree measure corresponding to the given radian

\(\text{(a) } 21^\circ \qquad \text{(b) } 22^\circ \qquad \text{(c) } 23^\circ \qquad \text{(d) } 24^\circ\)

\textbf{Solution:} (d)  
We have, \(\pi \text{ radians} = 180^\circ\)

\[
1^\circ = \frac{180^\circ}{\pi}; \quad \frac{2\pi}{15}^\circ = \frac{2\pi}{15} \times \frac{180^\circ}{\pi} = 24^\circ.
\]

\textbf{Example: 3}  
The angles of a quadrilateral are in A.P. and the greatest angle is 120\(^\circ\), the angles in radians are

\(\text{(a) } \frac{\pi}{3}, \frac{4\pi}{9}, \frac{5\pi}{9} \qquad \text{(b) } \frac{\pi}{3}, \frac{2\pi}{3}, \frac{3\pi}{3} \qquad \text{(c) } \frac{5\pi}{18}, \frac{8\pi}{18}, \frac{11\pi}{18}, \frac{12\pi}{18} \qquad \text{(d) } \text{None of these}\)

\textbf{Solution:} (a)  
Let the angles in degrees be \(\alpha - 3\delta, \alpha - \delta, \alpha + \delta, \alpha + 3\delta\)

Sum of the angles = 4\(\alpha\) = 360\(^\circ\) \quad \therefore \quad \alpha = 90^\circ

Also greatest angle = \(\alpha + 3\delta = 120^\circ\) \quad \therefore \quad \delta = 10^\circ

Hence the angles are 90\(^\circ\) - 30\(^\circ\), 90\(^\circ\) - 10\(^\circ\), 90\(^\circ\) + 10\(^\circ\) and 90\(^\circ\) + 30\(^\circ\)

That is, the angles in degrees are 60\(^\circ\), 80\(^\circ\), 100\(^\circ\) and 120\(^\circ\)

\(\therefore\) In terms of radians the angles are \(60\times \frac{\pi}{180}, 80\times \frac{\pi}{180}, 100\times \frac{\pi}{180}\) and \(120\times \frac{\pi}{180}\) that is \(\frac{\pi}{3}, \frac{4\pi}{9}, \frac{5\pi}{9}\) and \(\frac{2\pi}{3}\).
Example: 4  The minute hand of a clock is 10 cm long. How far does the tip of the hand move in 20 minutes
(a) \( \frac{10\pi}{3} \) cm  (b) \( \frac{20\pi}{3} \) cm  (c) \( \frac{30\pi}{3} \) cm  (d) \( \frac{40\pi}{3} \) cm

Solution: (b) We know that the tip of the minute hand makes one complete round in one hour i.e. 60 minutes since the length of the hand is 10 cm. The distance moved by its tip in 60 minutes is \( \pi \times 10 \text{ cm} \).

Hence the distance in 20 minutes is \( \frac{20\pi}{60} \times 10 \text{ cm} = \frac{20\pi}{3} \text{ cm} \).

Example: 5  The angle subtended at the centre of radius 3 metres by the arc of length 1 metre is equal to  
(a) 20°  (b) 60°  (c) \( \frac{1}{3} \) radian  (d) 3 radian

Solution: (c) Required angle = \( \frac{\text{Arc}}{\text{radius}} = \frac{1}{3} \) radian.

1.5 Trigonometrical Ratios or Functions

In the right angled triangle \( OMP \), we have base = \( OM = x \), perpendicular = \( PM = y \) and hypotenuses = \( OP = r \). We define the following trigonometric ratio which are also known as trigonometric function.

\[
\begin{align*}
\sin \theta &= \frac{\text{Perpendicular}}{\text{Hypotenues}} = \frac{y}{r} \\
\cos \theta &= \frac{\text{Base}}{\text{Hypotenues}} = \frac{x}{r} \\
\tan \theta &= \frac{\text{Perpendicular}}{\text{Base}} = \frac{y}{x} \\
\cot \theta &= \frac{\text{Base}}{\text{Perpendicular}} = \frac{x}{y} \\
\sec \theta &= \frac{\text{Hypotenues}}{\text{Base}} = \frac{r}{x} \\
\cosec \theta &= \frac{\text{Hypotenues}}{\text{Perpendicular}} = \frac{r}{y}.
\end{align*}
\]

(1) Relation between trigonometric ratio (function)

(i) \( \sin \theta \cdot \cosec \theta = 1 \)  (ii) \( \tan \theta \cdot \cot \theta = 1 \)  (iii) \( \cos \theta \cdot \sec \theta = 1 \)  (iv) \( \tan \theta = \frac{\sin \theta}{\cos \theta} \)  (v) \( \cot \theta = \frac{\cos \theta}{\sin \theta} \)

(2) Fundamental trigonometric identities

(i) \( \sin^2 \theta + \cos^2 \theta = 1 \)  (ii) \( 1 + \tan^2 \theta = \sec^2 \theta \)  (iii) \( 1 + \cot^2 \theta = \cosec^2 \theta \)

**Important Tips**

\( \frac{x}{\sec \theta} + \tan \theta, \text{then } \frac{1}{x} = \sec \theta - \tan \theta \).

\( \frac{x}{\cosec \theta} + \cot \theta, \text{then } \frac{1}{x} = \cosec \theta - \cot \theta \).

(3) Sign of trigonometrical ratios or functions: Their signs depends on the quadrant in which the terminal side of the angle lies.

(i) In first quadrant: \( x > 0, y > 0 \Rightarrow \sin \theta = \frac{y}{r} > 0, \cos \theta = \frac{x}{r} > 0, \tan \theta = \frac{y}{x} > 0, \cosec \theta = \frac{r}{y} > 0 \), \( \sec \theta = \frac{r}{x} > 0 \) and \( \cot \theta = \frac{x}{y} > 0 \). Thus, in the first quadrant all trigonometric functions are positive.
(ii) **In second quadrant**: $x < 0, y > 0 \Rightarrow \sin \theta = \frac{y}{r} > 0, \cos \theta = \frac{x}{r} < 0, \tan \theta = \frac{y}{x} < 0, \cosec \theta = \frac{r}{y} > 0$,
sec $\theta = \frac{r}{x} < 0$ and cot $\theta = \frac{x}{y} > 0$. Thus, in the second quadrant sin and cosec function are positive and all others are negative.

(iii) **In third quadrant**: $x < 0, y < 0 \Rightarrow \sin \theta = \frac{y}{r} < 0, \cos \theta = \frac{x}{r} < 0, \tan \theta = \frac{y}{x} > 0, \cosec \theta = \frac{r}{y} < 0$,
sec $\theta = \frac{r}{x} < 0$ and cot $\theta = \frac{x}{y} > 0$. Thus, in the third quadrant all trigonometric functions are negative except tangent and cotangent.

(iv) **In fourth quadrant**: $x > 0, y < 0 \Rightarrow \sin \theta = \frac{y}{r} < 0$,
$\cos \theta = \frac{x}{r} > 0$, $\tan \theta = \frac{y}{x} < 0$, $\cosec \theta = \frac{r}{y} > 0$ and cot $\theta = \frac{x}{y} < 0$. Thus, in the fourth quadrant all trigonometric functions are negative except cos and sec.

In brief: A crude aid to memorise the signs of trigonometrical ratio in different quadrant. "Add Sugar To Coffee".

**Important Tips**

- First determine the sign of the trigonometric function.
- If $\theta$ is measured from $X'OX$ i.e., $\{\pi \pm \theta, 2\pi - \theta\}$ then retain the original name of the function.
- If $\theta$ is measured from $Y'YO$ i.e., $\{\frac{\pi}{2} \pm \theta, \frac{3\pi}{2} \pm \theta\}$, then change sine to cosine, cosine to sine, tangent to cotangent, cot to tan, sec to cosec and cosec to sec.

(4) **Variations in values of trigonometric functions in different quadrants**: Let $X'OX$ and $YOY'$ be the coordinate axes. Draw a circle with centre at origin $O$ and radius unity.

Let $M(x, y)$ be a point on the circle such that $\angle AOM = \theta$ then $x = \cos \theta$ and $y = \sin \theta$ ; $-1 \leq \cos \theta \leq 1$ and $-1 \leq \sin \theta \leq 1$ for all values of $\theta$.

### III-Quadrant (T) | IV-Quadrant (C) |
| \( \sin \theta \rightarrow \) decreases from 0 to \(-1 \) | \( \sin \theta \rightarrow \) increases from \(-1 \) to 0 |
| \( \cos \theta \rightarrow \) increases from \(-1 \) to 0 | \( \cos \theta \rightarrow \) increases from 0 to 1 |
| \( \tan \theta \rightarrow \) increases from 0 to \(\infty \) | \( \tan \theta \rightarrow \) increases from \(-\infty \) to 0 |
| \( \cot \theta \rightarrow \) decreases from \(\infty \) to 0 | \( \cot \theta \rightarrow \) decreases from 0 to \(-\infty \) |
| \( \sec \theta \rightarrow \) decreases from \(-1 \) to \(-\infty \) | \( \sec \theta \rightarrow \) increases from \(-\infty \) to \(-1 \) |
| \( \csc \theta \rightarrow \) decreases from \(-\infty \) to \(-1 \) | \( \csc \theta \rightarrow \) decreases from \(-1 \) to \(-\infty \) |

*Note: \( \infty \) and \(-\infty \) are two symbols. These are not real numbers. When we say that \( \tan \theta \) increases from 0 to \(\infty \) as \( \theta \) varies from 0 to \(\pi/2 \), it means that \( \tan \theta \) increases in the interval \((0, \pi/2)\) and it attains large positive values as \( \theta \) tends to \(\pi/2 \). Similarly for other trigonometric functions.*

#### Example: 6
If \( \sin \theta + \csc \theta = 2 \), then \( \sin^2 \theta + \csc^2 \theta = \)

- (a) 1
- (b) 4
- (c) 2
- (d) None of these

**Solution:** (c) \( \sin^2 \theta + \csc^2 \theta = (\sin \theta + \csc \theta)^2 - 2 \sin \theta \cdot \cos \theta = 2^2 - 2 = 2 \).

#### Example: 7
If \( \sin \theta + \cos \theta = m \) and \( \sec \theta + \cosec \theta = n \), then \( n(m^2 + 1) \) equal to

- (a) \( m \)
- (b) \( n \)
- (c) \( 2 \)
- (d) \( 2n \)

**Solution:** (c) \( n(m^2 - 1) = (\sec \theta + \cosec \theta)\cdot 2 \sin \theta \cdot \cos \theta \) \( \Rightarrow m^2 = 1 + 2 \sin \theta \cdot \cos \theta \)

#### Example: 8
If \( \tan \theta = \frac{x}{1 - x \cos \phi} \) and \( \tan \phi = \frac{y}{1 - y \cos \theta} \), then \( x/y \) equal to

- (a) \( \frac{\sin \phi}{\sin \theta} \)
- (b) \( \frac{\sin \theta}{\sin \phi} \)
- (c) \( \frac{\sin \phi}{1 - \cos \theta} \)
- (d) \( \frac{\sin \theta}{1 - \cos \phi} \)

**Solution:** (b) \( x \sin \phi = \tan \theta = x \cos \phi \cdot \tan \phi \)

\[
\frac{x}{\sin \phi} = \frac{\tan \theta}{1 - x \cos \phi} = \frac{\sin \theta}{\sin \phi \cos \phi + \cos \theta \sin \phi}
\]

Similarly, \( \frac{y}{\sin \phi} = \frac{\sin \theta}{\sin \phi \cos \phi + \cos \theta \sin \phi} \); \( x/y = \frac{\sin \theta}{\sin \phi} \)

#### Example: 9
The equation \( \sec^2 \theta = \frac{4xy}{(x+y)^2} \) is only possible when
Trigonometrical Ratios, Functions and Identities

(a) \( x = y \)  
(b) \( x < y \)  
(c) \( x > y \)  
(d) None of these

Solution:  
(a) \( \cos^2 \theta \leq 1 \)  
(b) \( \sec^2 \theta = \frac{4xy}{(x+y)^2} \geq 1 \)  
(c) \( y \geq (x+y)^2 \)  
(d) None of these

Which is possible only when \( x = y \)  
(\( \therefore x, y \in \mathbb{R} \))

Example: 10

\[ \frac{1 - \sin \theta}{1 + \sin \theta} \]  
(a) 0  
(b) 1  
(c) \( \sec \theta - \tan \theta \)  
(d) \( \sec \theta \cdot \tan \theta \)

Solution:  
(c) \( \frac{(1 - \sin \theta)^2}{(1 - \sin^2 \theta)} = \frac{1 - \sin \theta}{\cos \theta} = \sec \theta - \tan \theta \).

Example: 11

If \( \tan A + \cot A = 4 \), then \( \tan^4 A + \cot^4 A \) is equal to

(a) 110  
(b) 191  
(c) 80  
(d) 194

Solution:  
(d) \( \tan A + \cot A = 4 \)  
(b) \( 191 \)  
(c) \( 80 \)  
(d) \( 194 \)

Example: 12

If \( \sin x + \cos x = \frac{1}{5} \), then \( \tan 2x \) is

(a) \( \frac{25}{17} \)  
(b) \( \frac{7}{25} \)  
(c) \( \frac{25}{7} \)  
(d) \( \frac{24}{7} \)

Solution:  
(d) \( \frac{24}{7} \)

Example: 13

If \( \sin x = \frac{24}{25} \), then the value of \( \tan x \) is

(a) \( \frac{24}{25} \)  
(b) \( \frac{-24}{7} \)  
(c) \( \frac{25}{24} \)  
(d) None of these

Solution:  
(b) \( \frac{-24}{7} \)

Example: 14

If \( \tan \theta + \sec \theta = e^x \), then \( \cos \theta \) equals

(a) \( \frac{e^x + e^{-x}}{2} \)  
(b) \( \frac{2}{e^x + e^{-x}} \)  
(c) \( \frac{e^x - e^{-x}}{2} \)  
(d) \( \frac{e^x - e^{-x}}{e^x + e^{-x}} \)

Solution:  
(b) \( \frac{2}{e^x + e^{-x}} \)

Example: 15

For \( 0 < \phi < \frac{\pi}{2} \), if \( x = \sum_{n=0}^{\infty} \cos 2^n \phi \), \( y = \sum_{n=0}^{\infty} \sin 2^n \phi \), \( z = \sum_{n=0}^{\infty} \cos 2^n \phi \sin 2^n \phi \), then

(a) \( xyz = xy + x \)  
(b) \( xyz = xy + z \)  
(c) \( xyz = x + y + z \)  
(d) Both (b) and (c)

Solution:  
(d) From \( s_n = \frac{a}{1-r} \)
We get, \( x = \frac{1}{1 - \cos^2 \phi} = \frac{1}{\sin^2 \phi}, \quad y = \frac{1}{1 - \sin^2 \phi} = \frac{1}{\cos^2 \phi}, \quad z = \frac{1}{1 - \cos^2 \phi \sin^2 \phi} = \frac{1}{1 - \frac{1}{xy}} \)

\( \Rightarrow xyz - z = xy \Rightarrow xyz = xy + z \)

Also, \( \frac{1}{x} + \frac{1}{y} = \cos^2 \phi + \sin^2 \phi = 1 \Rightarrow x + y = xy; \) From (i), \( xyz = x + y + z. \)

Example: 16
If \( P = \frac{2 \sin \theta}{1 + \sin \theta + \cos \theta} \) and \( Q = \frac{\cos \theta}{1 + \sin \theta}, \) then

- (a) \( PQ = 1 \)
- (b) \( \frac{Q}{P} = 1 \)
- (c) \( Q - P = 1 \)
- (d) \( Q + P = 1 \)

Solution: (d)
\[ P + Q = \frac{2 \sin \theta}{1 + \sin \theta + \cos \theta} + \frac{\cos \theta}{1 + \sin \theta} \]
After solving, \( P + Q = 1. \)

Example: 17
The value of \( 6(\sin^6 \theta + \cos^6 \theta) - 9(\sin^4 \theta + \cos^4 \theta) + 4 \) equals to

- (a) -3
- (b) 0
- (c) 1
- (d) 3

Solution: (c)
\[ = 6(\sin^6 \theta + \cos^6 \theta) - 9(\sin^4 \theta + \cos^4 \theta) + 4 \]
\[ = 6(\sin^2 \theta + \cos^2 \theta)^3 - 9(\sin^2 \theta + \cos^2 \theta)^2 - 9(\sin^2 \theta + \cos^2 \theta)^2 - 2 \sin^2 \theta \cdot \cos^2 \theta + 4 \]
\[ = 6[1 - 3 \sin^2 \theta \cdot \cos^2 \theta] - 9[1 - 2 \sin^2 \theta \cdot \cos^2 \theta] + 4 = 6 - 9 + 4 = 1. \]

Example: 18
\( \sin \theta \cdot \sin \theta \cdot \sin \theta \cdot \cos \theta \cdot \cos \theta \)
\( \equiv \frac{\sin \theta}{1 - \cot \theta} + \frac{\cos \theta}{1 - \tan \theta} \]
equals to

- (a) 0
- (b) 1
- (c) \( \cos \theta - \sin \theta \)
- (d) \( \cos \theta + \sin \theta \)

Solution: (d)
\[ \frac{\sin \theta \cdot \sin \theta}{1 - \cot \theta} + \frac{\cos \theta \cdot \cos \theta}{1 - \tan \theta} = \frac{\sin^2 \theta}{\cos \theta - \sin \theta} + \frac{\cos^2 \theta}{\cos \theta - \sin \theta} = \frac{\cos^2 \theta - \sin^2 \theta}{\cos \theta - \sin \theta} = \cos \theta + \sin \theta. \]

1.6 Trigonometrical Ratios of Allied Angles

Two angles are said to be allied when their sum or difference is either zero or a multiple of \( 90^\circ. \)

(1) **Trigonometric ratios of \( (- \theta) \):** Let a revolving ray, starting from its initial position \( OX, \) trace out an angle \( \angle XOA = \theta. \) Let \( P(x, y) \) be a point on \( OA \) such that \( OP = r. \) Draw \( PM \perp \) from \( P \) on \( x \)-axis. Angle \( \angle XOA' = -\theta \) in the clockwise sense. Let \( P' \) be a point on \( OA' \) such that \( OP = OP. \) Clearly \( M \) and \( M' \) coincide and \( \triangle OMP \) is congruent to \( \triangle OMP' \) then \( P' \) are \( (x, -y). \)

\[ \sin(-\theta) = -\frac{y}{r} \Rightarrow -\frac{y}{r} = -\sin \theta; \quad \cos(-\theta) = \frac{x}{r} = \cos \theta; \quad \tan(-\theta) = -\frac{y}{x} = -\tan \theta \]

Taking the reciprocal of these trigonometric ratios;
\[ \cosec(-\theta) = -\cosec \theta, \quad \sec(-\theta) = \sec \theta \quad \text{and} \quad \cot(-\theta) = -\cot \theta \]

**Note:**
- \( \square \) A function \( f(x) \) is said to be an even function if \( f(-x) = f(x) \) for all \( x \) in its domain.
- \( \square \) A function \( f(x) \) is said to be an odd function if \( f(-x) = -f(x) \) for all \( x \) in its domain.
- \( \square \) \( \sin \theta, \tan \theta, \cot \theta, \cosec \theta \) are odd functions and \( \cos \theta, \sec \theta \) are even functions.
(2) **Trigonometric function of** \((90 - \theta)\): Let the revolving line, starting from \(OA\), trace out any acute angle \(AOP\), equal to \(\theta\). From any point \(P\), draw \(PM \perp OA\). Three angles of a triangle are together equal to two right angles, and since \(OMP\) is a right angle, the sum of the two angles \(MOP\) and \(OPM\) is right angle. \(\angle OPM = 90^\circ - \theta\)

[When the angle \(OPM\) is consider, the line \(PM\) is the ‘base’ and \(MO\) is the ‘perpendicular’]

\[
\sin(90^\circ - \theta) = \sin MPO = \frac{MO}{PO} = \cos AOP = \cos \theta , \quad \cos(90^\circ - \theta) = \cos MPO = \frac{PM}{PO} = \sin AOP = \sin \theta \\
\tan(90^\circ - \theta) = \tan MPO = \frac{MO}{PM} = \cot AOP = \cot \theta , \quad \cot(90^\circ - \theta) = \cot MPO = \frac{PM}{MO} = \tan AOP = \tan \theta \\
cosec(90^\circ - \theta) = cosec MPO = \frac{PO}{MO} = sec AOP = sec \theta , \quad sec(90^\circ - \theta) = sec MPO = \frac{PO}{PM} = cosec AOP = cosec \theta
\]

(3) **Trigonometric function of** \((90 + \theta)\): Let a revolving ray \(OA\) starting from its initial position \(OX\), trace out an angle \(\angle XO\)A = \(\theta\) and let another revolving ray \(OA'\) starting from the same initial position \(OX\), first trace out an angle \(\theta\). So as to coincide with \(OA\) and then it revolves through an angle of \(90^\circ\) in anticlockwise direction to form an angle \(\angle XO\)A' = \(90^\circ + \theta\).

Let \(P\) and \(P'\) be points on \(OA\) and \(OA'\) respectively such that \(OP = OP' = r\).

Draw perpendicular \(PM\) and \(PM'\) from \(P\) and \(P'\) respectively on \(OX\). Let the coordinates of \(P\) be \((x, y)\). Then \(OM = x\) and \(PM = y\) clearly, \(OM' = PM = y\) and \(P'M' = OM = x\).

So the coordinates of \(P'\) are \(-y, x\)

\[
\sin(90^\circ + \theta) = \sin MPO' = \frac{x}{y} = \cos \theta , \quad \cos(90^\circ + \theta) = \frac{OM'}{OP'} = \frac{y}{x} = -\sin \theta \\
\tan(90^\circ + \theta) = \frac{M'P'}{OM'} = \frac{x}{-y} = -\cot \theta , \quad \cot(90^\circ + \theta) = -\tan \theta , \quad sec(90^\circ + \theta) = -\cosec \theta , \quad cosec(90^\circ + \theta) = \sec \theta
\]

**Important Tips**

- \(\sin n\pi = 0, \quad \cos n\pi = (-1)^n\)
- \(\sin(n\pi + \theta) = (-1)^n \sin \theta , \quad \cos(n\pi + \theta) = (-1)^n \cos \theta\)

Important Tips

- Values for some standard angles:
  - \( \sin 15^\circ = \cos 75^\circ = \frac{\sqrt{3} - 1}{2\sqrt{2}} \)
  - \( \cos 15^\circ = \sin 75^\circ = \frac{\sqrt{3} + 1}{2\sqrt{2}} \)
  - \( \tan 15^\circ = \cot 75^\circ = 2 - \sqrt{3} \)
  - \( \sin 18^\circ = \cos 72^\circ = \frac{\sqrt{5} - 1}{4} \)
  - \( \cos 18^\circ = \sin 72^\circ = \frac{\sqrt{5} + 1}{4} \)
  - \( \tan 75^\circ = \cot 15^\circ = 2 + \sqrt{3} \)
  - \( \sin 22\frac{1}{2}^\circ = \cos 67\frac{1}{2}^\circ = \frac{\sqrt{2} - \sqrt{2}}{2} \)
  - \( \cos 22\frac{1}{2}^\circ = \sin 67\frac{1}{2}^\circ = \frac{\sqrt{2} + \sqrt{2}}{2} \)
  - \( \tan 22\frac{1}{2}^\circ = \cot 67\frac{1}{2}^\circ = \sqrt{2} + 1 \)

Pratap Bhawan, Behind Leela Cinema, Hazrat Ganj, Lucknow
PH.(0522) 4026913, 9838162263
Example: 19 \( \sin 75^o = \)  
(a) \( \frac{2 - \sqrt{3}}{2} \) \hspace{1cm} (b) \( \sqrt{3} + 1 \) \hspace{1cm} (c) \( -\frac{\sqrt{3} - 1}{2\sqrt{2}} \) \hspace{1cm} (d) \( \frac{\sqrt{3} - 1}{2\sqrt{2}} \)

Solution: (b) \( \sin 75^o = \sin(45^o + 30^o) = \sin 45^o \cos 30^o + \cos 45^o \sin 30^o = \frac{1}{\sqrt{2}} \cdot \frac{\sqrt{3}}{2} + \frac{1}{\sqrt{2}} \cdot \frac{1}{2} = \frac{\sqrt{3} + 1}{2\sqrt{2}} \).

Example: 20 The value of \( \cos A - \sin A \), when \( A = \frac{5\pi}{4} \) is

(a) \( \sqrt{2} \) \hspace{1cm} (b) \( \frac{1}{\sqrt{2}} \) \hspace{1cm} (c) 0 \hspace{1cm} (d) 1

Solution: (c) \( \cos \frac{5\pi}{4} - \sin \frac{5\pi}{4} = -\cos \frac{\pi}{4} + \sin \frac{\pi}{4} = -\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} = 0 \).

Example: 21 \( \tan A + \cot(180^o + A) + \cot(90^o + A) + \cot(360^o - A) \) equal to

(a) 0 \hspace{1cm} (b) 2\tan A \hspace{1cm} (c) 2\cot A \hspace{1cm} (d) 2(\tan A - \cot A)

Solution: (a) \( \tan A + \cot A + (-\tan A) + (-\cot A) = 0 \).

Example: 22 The value of \( \cos 15^o - \sin 15^o \) equal to

(a) \( \frac{1}{\sqrt{2}} \) \hspace{1cm} (b) \( \frac{1}{2} \) \hspace{1cm} (c) \( -\frac{1}{\sqrt{2}} \) \hspace{1cm} (d) Zero

Solution: (a) \( \sqrt{3} + 1 \) \hspace{1cm} (b) \( \frac{1}{2} \) \hspace{1cm} (c) \( -\frac{1}{\sqrt{2}} \) \hspace{1cm} (d) \( \sin 4\alpha + \sin 6\alpha \)

Example: 23 \( 3\sin^4\left(\frac{3\pi}{2} - \alpha\right) + \sin^4(3\pi + \alpha) - 2\sin^6\left(\frac{\pi}{2} + \alpha\right) + \sin^6(5\pi - \alpha) \)

(a) 0 \hspace{1cm} (b) 1 \hspace{1cm} (c) 3 \hspace{1cm} (d) \( \sin 4\alpha + \sin 6\alpha \)

Solution: (b) \( 3(-\cos^2\alpha)^3 + (-\sin^2\alpha)^3 - 2\cos^6\alpha + \sin^6\alpha \)

Example: 24 Which of the following number is rational

(a) \( \sin 15^o \) \hspace{1cm} (b) \( \cos 15^o \) \hspace{1cm} (c) \( \sin 15^o \cdot \cos 15^o \) \hspace{1cm} (d) \( \sin 15^o \cdot \cos 75^o \)

Solution: (c) \( \sin 15^o = \sin(45^o - 30^o) = \frac{\sqrt{3} - 1}{2\sqrt{2}} \) is irrational \( \Rightarrow \cos 15^o = \cos(45^o - 30^o) = \frac{\sqrt{3} + 1}{2\sqrt{2}} \) is irrational

Example: 25 If \( \sin x + \sin^2 x = 1 \), then the value of \( \cos^{12} x + 3\cos^{10} x + 3\cos^8 x + \cos^6 x - 2 \) is

(a) 0 \hspace{1cm} (b) 1 \hspace{1cm} (c) -1 \hspace{1cm} (d) 2

Solution: (c) Since \( \sin x + \sin^2 x = 1 \) \( \Rightarrow \sin x = 1 - \sin^2 x = \cos^2 x \)

From given expression, \( \cos^6 x(\cos^6 x + 3\cos^4 x + 3\cos^2 x + 1) - 2 = \cos^6 x(\cos^2 x + 1)^3 - 2 \).
From (i) \( \sin x = \cos^2 x \)

\[ \therefore \sin^3 x(\sin x + 1)^3 - 2 = (\sin^2 x + \sin x)^3 - 2 = 1 - 2 = -1. \]

**Example: 26**

If \( 4 \sin \theta = 3 \cos \theta \) then \( \frac{\sec^2 \theta}{4[1 - \tan^2 \theta]} \) equals to

(a) \( \frac{25}{16} \)  (b) \( \frac{25}{28} \)  (c) \( \frac{1}{4} \)  (d) 1

**Solution:** (b) Given \( 4 \sin \theta = 3 \cos \theta \) \( \Rightarrow \tan \theta = \frac{3}{4} \)

The given expression is \( \frac{\sec^2 \theta}{4[1 - \tan^2 \theta]} = \frac{1 + \tan^2 \theta}{4[1 - \tan^2 \theta]} = \frac{1 + \frac{9}{16}}{4[1 - \frac{9}{16}]} = \frac{25}{28}. \)

### 1.9 Formulae for the Trigonometric Ratios of Sum and Differences of Two Angles

1. \( \sin(A + B) = \sin A \cos B + \cos A \sin B \)
2. \( \sin(A - B) = \sin A \cos B - \cos A \sin B \)
3. \( \cos(A + B) = \cos A \cos B - \sin A \sin B \)
4. \( \cos(A - B) = \cos A \cos B + \sin A \sin B \)
5. \( \tan(A + B) = \frac{\tan A + \tan B}{1 - \tan A \tan B} \)
6. \( \tan(A - B) = \frac{\tan A - \tan B}{1 + \tan A \tan B} \)
7. \( \cot(A + B) = \frac{\cot A \cot B - 1}{\cot A + \cot B} \)
8. \( \cot(A - B) = \frac{\cot A \cot B + 1}{\cot B - \cot A} \)
9. \( \sin(A + B), \sin(A - B) = \sin^2 A - \sin^2 B = \cos^2 B - \cos^2 A \)
10. \( \cos(A + B), \cos(A - B) = \cos^2 A - \sin^2 B = \cos^2 B - \sin^2 A \)
11. \( \tan A \pm \tan B = \frac{\sin A \pm \sin B}{\cos A \pm \cos B} = \frac{\sin A \cos B \pm \cos A \sin B}{\cos A \cos B} = \sin \frac{A \mp B}{\cos A \cos B} \quad \left( A \neq n\pi \pm \frac{\pi}{2}, B \neq m\pi \right) \)
12. \( \cot A \pm \cot B = \frac{\sin(B \pm A)}{\sin A \sin B} \)

### 1.10 Formulae for the Trigonometric Ratios of Sum and Differences of Three Angles

1. \( \sin(A + B + C) = \sin A \cos B \cos C + \cos A \sin B \cos C + \cos A \cos B \sin C - \sin A \sin B \sin C \)
   or \( \sin (A + B + C) = \cos A \cos B \cos C (\tan A + \tan B + \tan C - \tan A \tan B \tan C) \)
2. \( \cos(A + B + C) = \cos A \cos B \cos C - \sin A \sin B \cos C - \sin A \cos B \sin C - \cos A \sin B \sin C \)
   \( \cos(A + B + C) = \cos A \cos B \cos C (1 + \tan A \tan B + \tan B \tan C + \tan C \tan A) \)
3. \( \tan(A + B + C) = \frac{\tan A + \tan B + \tan C - \tan A \tan B \tan C}{1 - \tan A \tan B - \tan B \tan C - \tan C \tan A} \)
4. \( \cot(A + B + C) = \frac{\cot A \cot B \cot C - \cot A - \cot B - \cot C}{\cot A \cot B + \cot B \cot C + \cot C \cot A - 1} \)
In general;

(5) \( \sin(A_1 + A_2 + \ldots + A_n) = \cos A_1 \cos A_2 \ldots \cos A_n (S_1 - S_3 + S_5 - S_7 + \ldots) \)

(6) \( \cos(A_1 + A_2 + \ldots + A_n) = \cos A_1 \cos A_2 \ldots \cos A_n (1 - S_2 + S_4 - S_6 \ldots) \)

(7) \( \tan(A_1 + A_2 + \ldots + A_n) = \frac{S_1 - S_3 + S_5 - S_7 + \ldots}{1 - S_2 + S_4 - S_6 + \ldots} \)

Where; \( S_1 = \tan A_1 + \tan A_2 + \ldots + \tan A_n \) = The sum of the tangents of the separate angles.

\( S_2 = \tan A_1 \tan A_2 + \tan A_1 \tan A_3 + \ldots = \) The sum of the tangents taken two at a time.

\( S_3 = \tan A_1 \tan A_2 \tan A_3 + \tan A_2 \tan A_3 \tan A_4 + \ldots = \) Sum of tangents three at a time, and so on.

If \( A_1 = A_2 = \ldots = A_n = A \), then \( S_1 = n \tan A \), \( S_2 = n^2 \tan^2 A \), \( S_3 = n^3 \tan^3 A \), etc.

(8) \( \sin nA = \cos^n A \left( \tan^2 A \right)^{n/2} \cos A - \ldots \)

(9) \( \cos nA = \cos^n A \left( 1 - \tan^2 A \right)^{n/2} \cos A - \ldots \)

(10) \( \tan nA = \frac{n \tan A - \tan^3 A + \tan^5 A - \ldots}{1 - n \tan^2 A + \tan^4 A - \ldots} \)

(11) \( \sin nA + \cos nA = \cos^n A \left( \tan^2 A \right)^{n/2} \cos A + \ldots \)

(12) \( \sin nA - \cos nA = \cos^n A \left( 1 - \tan^2 A \right)^{n/2} \cos A + \ldots \)

(13) \( \sin(\alpha) + \sin(\alpha + \beta) + \sin(\alpha + 2\beta) + \ldots + \sin(\alpha + (n-1)\beta) = \frac{\sin(\alpha + (n-1)(\beta / 2)) \cdot \sin(n\beta / 2)}{\sin(\beta / 2)} \)

(14) \( \cos(\alpha) + \cos(\alpha + \beta) + \cos(\alpha + 2\beta) + \ldots + \cos(\alpha + (n-1)\beta) = \frac{\cos(\alpha + (n-1)(\beta / 2)) \cdot \sin(n \cdot (\beta / 2))}{\sin(\beta / 2)} \)

1.11 Formulae to Transform the Product into Sum or Difference

(1) \( 2 \sin A \cos B = \sin(A + B) + \sin(A - B) \)

(2) \( 2 \cos A \sin B = \sin(A + B) - \sin(A - B) \)

(3) \( 2 \cos A \cos B = \cos(A + B) + \cos(A - B) \)

(4) \( 2 \sin A \sin B = \cos(A - B) - \cos(A + B) \)

Let \( A + B = C \) and \( A - B = D \)

Then, \( A = \frac{C + D}{2} \) and \( B = \frac{C - D}{2} \)

Therefore, we find out the formulae to transform the sum or difference into product.

(5) \( \sin C + \sin D = 2 \sin \frac{C + D}{2} \cos \frac{C - D}{2} \)

(6) \( \sin C - \sin D = 2 \cos \frac{C + D}{2} \sin \frac{C - D}{2} \)

(7) \( \cos C + \cos D = 2 \cos \frac{C + D}{2} \cos \frac{C - D}{2} \)

(8) \( \cos C - \cos D = 2 \sin \frac{C + D}{2} \sin \frac{C - D}{2} \)
Important Tips

\[ \sin(60^\circ - \theta) \cdot \sin \theta \sin(60^\circ + \theta) = \frac{1}{4} \sin 3\theta \]

\[ \cos(60^\circ - \theta) \cdot \cos \theta \cos(60^\circ + \theta) = \frac{1}{4} \cos 3\theta \]

\[ \tan(60^\circ - \theta) \cdot \tan \theta \tan(60^\circ + \theta) = \tan 3\theta \]

\[ \cos A \cos 2A \cos 2^2 A \cos 2^3 A \ldots \cos 2^n - 1 A = \frac{\sin 2^n A}{2^n \sin A} \quad \text{if} \ A = n\pi \]

\[ \text{and} \ \frac{\sin 2^n A}{2^n \sin A} = 1, \text{if} \ A = 2n\pi \]

\[ = 1, \text{if} \ A = (2n + 1)\pi \]

Example: 27

\[
\begin{align*}
\frac{\cos 12^\circ - \sin 12^\circ}{\cos 12^\circ + \sin 12^\circ} &= \frac{\sin 147^\circ}{\cos 147^\circ} \\
(\text{a}) &\ 2\tan 33^\circ & (\text{b}) &\ 1 & (\text{c}) &\ -1 & (\text{d}) &\ 0
\end{align*}
\]

Solution: (d) \( \frac{\cos 12^\circ - \sin 12^\circ}{\cos 12^\circ + \sin 12^\circ} + \tan 147^\circ = \tan(45^\circ - 12^\circ) + \tan(180^\circ - 33^\circ) = \tan 33^\circ + (-\tan 33^\circ) = 0 \)

Example: 28

If \( \sin \theta_1 + \sin \theta_2 + \sin \theta_3 = 3 \), then \( \cos \theta_1 + \cos \theta_2 + \cos \theta_3 = \)

\[
(\text{a}) \ 3 & (\text{b}) \ 2 & (\text{c}) \ 1 & (\text{d}) \ 0
\]

Solution: (d) We know \( |\sin \theta| \leq 1 \); So, each \( \theta_1, \theta_2 \) and \( \theta_3 \) must be equal to \( \pi / 2 \).

\[ \therefore \ \cos \theta_1 + \cos \theta_2 + \cos \theta_3 = 0 \]

Example: 29

\[ \cos A + \cos(240^\circ + A) + \cos(240^\circ - A) = \]

\[
(\text{a}) &\ \cos A & (\text{b}) &\ 0 & (\text{c}) &\ \sqrt{3} \sin A & (\text{d}) &\ \sqrt{3} \cos A
\]

Solution: (b) \( \cos A + [2 \cos 240^\circ \cos A] = \cos A + 2(-\cos 60^\circ) \cos A = \cos A + \frac{1}{2} \cos A = \frac{3}{2} \cos A \]

Example: 30

\[ \sin^2 A - \sin^2 B = \]

\[
(\text{a}) &\ \tan(A - B) & (\text{b}) &\ \tan(A + B) & (\text{c}) &\ \cot(A - B) & (\text{d}) &\ \cot(A + B)
\]

Solution: (b) \( \frac{2 \sin^2 A - \sin^2 B}{2 \sin A \cos A - 2 \sin B \cos B} = \frac{2 \sin(A + B) \sin(A - B)}{2 \sin A \cos A - 2 \sin B \cos B} = \tan(A + B) \)

Example: 31

The expression \( \cos^2(A - B) + \cos^2 B - 2 \cos(A - B) \cos A \cos B \) is

\[
(\text{a}) \ \text{Dependent on} \ B & (\text{b}) \ \text{Dependent on} \ A \text{ and} \ B \]

\[
(\text{c}) \ \text{Dependent on} \ A & (\text{d}) \ \text{Independent of} \ A \text{ and} \ B
\]

Solution: (c) \( \cos^2(A - B) + \cos^2 B - \cos^2(A - B) \cos(A + B) = \cos^2 B - (\cos^2 A - \sin^2 B) = 1 - \cos^2 A \)

**Trick:** Put \( A = 90^\circ \) and \( 0^\circ \); the value is \( \sin^2 B + \cos^2 B = 1 \) and \( 0^\circ \); the value is \( \sin^2 A \) and \( \sin^2 A \) means expression depends on \( A \).

Example: 32

If \( \tan \alpha = \frac{m}{m+1} \) and \( \tan \beta = \frac{1}{2m+1} \) then \( \alpha + \beta = \)
If \( \Theta \) is independent of \( t \), then
\[ \cot \Theta = \frac{m}{6}, \quad \sin \Theta + \cos \Theta = b, \quad (b^2 - 1)^2(a^2 + 4) = \]

Therefore, \( \tan(\alpha + \beta) = \frac{1 + \frac{1}{3}}{1 - \frac{1}{6}} = 1 \), Hence \( \alpha + \beta = \frac{\pi}{4} \) (Also check for other values of \( m \)).

**Example: 33**

If \( \tan \theta - \cot \theta = a \) and \( \sin \theta + \cos \theta = b \), then \( (b^2 - 1)^2(a^2 + 4) = \)

**Solution: (d)**

Given that \( \tan \theta - \cot \theta = a \) ......(i) and \( \sin \theta + \cos \theta = b \) ......(ii)

Now, \( (b^2 - 1)^2(a^2 + 4) = (\sin \theta + \cos \theta)^2 - 1)^2 \{(\tan \theta - \cot \theta)^2 + 4 \}

\[ = [1 + \sin \theta - 1]^2(\sin^2 \theta + \cos^2 \theta - 2 + 4] = \sin^2 \theta (\cosec^2 \theta + \sec^2 \theta) = 4 \sin^2 \theta \cos^2 \theta \left[ \frac{1}{\sin^2 \theta} + 1 + \frac{1}{\cos^2 \theta} \right] = 4 \]

**Trick:** Obviously the value of expression \( (b^2 - 1)^2(a^2 + 4) \) is independent of \( \theta \), therefore put any suitable value of \( \theta \). Let \( \theta = 45^\circ \), we get \( a = 0 \), \( b = \sqrt{2} \) so that \((\sqrt{2})^2 - 1)^2(2^2 + 4) = 4 \).

**Example: 34**

If \( \sin B = \frac{1}{5} \sin(2A + B) \), then \( \tan(\alpha + B) = \)

**Solution: (c)**

\[ \frac{\sin(2A + B)}{\sin B} = \frac{5}{1} \]

by componendo and Dividendo. \( \frac{\sin(2A + B) + \sin B}{\sin(2A + B) - \sin B} = \frac{5 + 1}{5 - 1} = \frac{3}{2} \)

2 \sin(\alpha + B). \cos B = \frac{6}{4} \Rightarrow \tan(\alpha + B) = \frac{3}{2} \)

2 \cos(\alpha + B). \sin A = \frac{4}{4} \Rightarrow \tan A = \frac{2}{1} \)

**Example: 35**

\[ \frac{\sin 70^\circ + \cos 40^\circ}{\cos 70^\circ + \sin 40^\circ} = \]

**Solution: (c)**

\[ \frac{\sin 70^\circ + \cos 40^\circ}{\cos 70^\circ + \sin 40^\circ} = \frac{\sin 70^\circ + \sin 50^\circ}{\sin 20^\circ + \sin 40^\circ} = \frac{2 \sin 60^\circ \cos 10^\circ}{2 \sin 30^\circ \cos(-10^\circ)} = \frac{\sin 60^\circ}{2 \cdot \frac{1}{2}} = \frac{\sqrt{3}}{2}\].

**Example: 36**

\[ \sin 47^\circ + \sin 61^\circ - \sin 11^\circ - \sin 25^\circ = \]

**Solution:**

(a) \( \sin 36^\circ \) (b) \( \sin 7^\circ \) (c) \( \cos 36^\circ \) (d) \( \cos 7^\circ \)
Trigonometrical Ratios, Functions and Identities

Solution: (d) \[
\begin{align*}
\sin 47^\circ + \sin 61^\circ - (\sin 11^\circ + \sin 25^\circ) &= 2 \sin 54^\circ \cdot \cos 7^\circ - 2 \sin 18^\circ \cos 7^\circ \\
&= 2 \cos 7^\circ (\sin 54^\circ - \sin 18^\circ) = 2 \cos 7^\circ \cdot 2 \cos 36^\circ \cdot \sin 18^\circ = 4 \cdot \cos 7^\circ \cdot \sqrt{\frac{1}{4} + \frac{1}{4}} = \cos 7^\circ.
\end{align*}
\]

Example: 37
\[
\frac{\cos 10^\circ - \sin 10^\circ}{\cos 10^\circ + \sin 10^\circ} =
\begin{align*}
(a) \quad & \tan 55^\circ \\
(b) \quad & \cot 55^\circ \\
(c) \quad & - \tan 35^\circ \\
(d) \quad & - \cot 35^\circ
\end{align*}
\]

Solution: (b) \[
\frac{\cos 10^\circ - \sin 10^\circ}{1 + \tan 10^\circ} = \frac{1 - \tan 10^\circ}{1 + \tan 10^\circ} = \tan 35^\circ = \tan (90^\circ - 35^\circ) = \cot 55^\circ.
\]

Example: 38
If \( \tan (A + B) = p \) and \( \tan (A - B) = q \) then the value of \( \tan 2A = \)
\[
\begin{align*}
(a) \quad & \frac{p + q}{p - q} \\
(b) \quad & \frac{p - q}{1 + pq} \\
(c) \quad & \frac{1 + pq}{1 - p} \\
(d) \quad & \frac{p + q}{1 - pq}
\end{align*}
\]

Solution: (d) \[
2A = (A + B) + (A - B) \Rightarrow \tan 2A = \frac{\tan (A + B) + \tan (A - B)}{1 - \tan (A + B) \cdot \tan (A - B)} = \tan 2A = \frac{p + q}{1 - pq}
\]

Example: 39
\[
\sin 163^\circ \cos 347^\circ + \sin 73^\circ \sin 167^\circ =
\begin{align*}
(a) \quad & 0 \\
(b) \quad & \frac{1}{2} \\
(c) \quad & 1 \\
(d) \quad & \text{None of these}
\end{align*}
\]

Solution: (b) \[
\sin (90^\circ + 73^\circ), \cos (360^\circ - 13^\circ) + \sin 73^\circ \cdot \sin (180^\circ - 13^\circ) = \cos 73^\circ, \cos 13^\circ + \sin 73^\circ, \sin 13^\circ = \cos (73^\circ - 13^\circ) = \cos 60^\circ = \frac{1}{2}.
\]

Example: 40
The value of \( \cot 70^\circ + 4 \cos 70^\circ \) is
\[
\begin{align*}
(a) \quad & \frac{1}{\sqrt{3}} \\
(b) \quad & \sqrt{3} \\
(c) \quad & 2\sqrt{3} \\
(d) \quad & \frac{1}{2}
\end{align*}
\]

Solution: (b) \[
\cot 70^\circ + 4 \cos 70^\circ = \frac{\cos 70^\circ + 4 \sin 70^\circ, \cos 70^\circ}{\sin 70^\circ} = \frac{\cos 70^\circ + 2 \sin 140^\circ}{\sin 70^\circ} = \\
\frac{\cos 70^\circ + 2 \sin (180^\circ - 40^\circ)}{\sin 70^\circ} = \frac{\sin 20^\circ + \sin 40^\circ + \sin 40^\circ}{\sin 70^\circ} = \\
\frac{2 \sin 30^\circ \cos 10^\circ + \sin 40^\circ}{\sin 70^\circ} = \frac{\sin 80^\circ + \sin 40^\circ}{\sin 70^\circ} = 2 \sin 60^\circ \cos 20^\circ
\]

Example: 41
If \( \tan \alpha = (1 + 2^{-x})^{-1}, \tan \beta = (1 + 2^{-x+1})^{-1} \), then \( \alpha + \beta \) equals
\[
\begin{align*}
(a) \quad & \frac{\pi}{6} \\
(b) \quad & \frac{\pi}{4} \\
(c) \quad & \frac{\pi}{3} \\
(d) \quad & \frac{\pi}{2}
\end{align*}
\]

Solution: (b) \[
\tan (\alpha + \beta) = \frac{\tan \alpha + \tan \beta}{1 - \tan \alpha \tan \beta} = \tan (\alpha + \beta) = \\
\frac{1 + \frac{1}{2^{-x}}}{1 - \frac{1}{2^{-x}} \cdot 1} = \\
\frac{2^x + 2 \cdot 2^{-x} + 1}{1 + 2^x + 2 \cdot 2^{-x} - 2^x} = \tan (\alpha + \beta) = 1 = \tan \frac{\pi}{4} \Rightarrow \alpha + \beta = \frac{\pi}{4}.
\]

Example: 42
The value of \( \frac{\tan 70^\circ - \tan 20^\circ}{\tan 50^\circ} =
\begin{align*}
(a) \quad & 1 \\
(b) \quad & 2 \\
(c) \quad & 3 \\
(d) \quad & 0
\end{align*}
\]

Pratap Bhawan, Behind Leela Cinema, Hazrat Ganj, Lucknow
PH.(0522) 4026913, 9838162263
Solution: (b) 
\[
\begin{align*}
\frac{\sin 70^{\circ}}{\cos 70^{\circ}} \cdot \frac{\sin 20^{\circ}}{\cos 20^{\circ}} &= \frac{\sin 70^{\circ} \cos 20^{\circ} - \cos 70^{\circ} \sin 20^{\circ}}{\cos 70^{\circ} \cos 20^{\circ}} \quad \text{or} \quad \frac{\sin 20^{\circ}}{\cos 20^{\circ}} = \frac{\sin 70^{\circ} \cos 20^{\circ} - \cos 70^{\circ} \sin 20^{\circ}}{\cos 70^{\circ} \cos 20^{\circ}} \\
&= \frac{2 \cos 50^{\circ}}{\cos 90^{\circ} + \cos 50^{\circ}} = \frac{2 \cos 50^{\circ}}{0 + \cos 50^{\circ}} = 2.
\end{align*}
\]

1.12 Trigonometric Ratio of Multiple of an Angle

(1) \( \sin 2A = 2 \sin A \cos A = \frac{2 \tan A}{1 + \tan^2 A} \)

(2) \( \cos 2A = 2 \cos^2 A - 1 = 1 - 2 \sin^2 A = \cos^2 A - \sin^2 A = \frac{1 - \tan^2 A}{1 + \tan^2 A} \); where \( A \neq (2n + 1) \frac{\pi}{4} \).

(3) \( \tan 2A = \frac{2 \tan A}{1 - \tan^2 A} \)

(4) \( \sin 3A = 3 \sin A - 4 \sin^3 A = 4 \sin(60^{\circ} - A). \sin A. \sin(60^{\circ} + A) \)

(5) \( \cos 3A = 4 \cos^3 A - 3 \cos A = 4 \cos(60^{\circ} - A). \cos A. \cos(60^{\circ} + A) \)

(6) \( \tan 3A = \frac{3 \tan A - \tan^3 A}{1 - 3 \tan^2 A} = \tan(60^{\circ} - A). \tan A. \tan(60^{\circ} + A) \), where \( A \neq n\pi + \pi / 6 \).

(7) \( \sin 4\theta = 4 \sin \theta. \cos^3 \theta - 4 \cos \theta \sin^3 \theta \)

(8) \( \cos 4\theta = 8 \cos^4 \theta - 8 \cos^2 \theta + 1 \)

(9) \( \tan 4\theta = \frac{4 \tan \theta - 4 \tan^3 \theta}{1 - 6 \tan^2 \theta + \tan^4 \theta} \)

(10) \( \sin 5\theta = 16 \sin^5 \theta - 20 \sin^3 \theta + 5 \sin \theta \)

(11) \( \cos 5\theta = 16 \cos^5 \theta - 20 \cos^3 \theta + 8 \cos \theta \)

1.13 Trigonometric Ratio of Sub-multiple of an Angle

(1) \( \left| \frac{\sin A}{2} + \cos \frac{A}{2} \right| = \sqrt{1 + \sin A} \) or \( \sin \frac{A}{2} + \cos \frac{A}{2} = \pm \sqrt{1 + \sin A} \) i.e., \( +, \) if \( 2\pi - \pi / 4 \leq A / 2 \leq 2\pi + 3\pi / 4 \) \( - \), otherwise

(2) \( \left| \frac{\sin A}{2} - \cos \frac{A}{2} \right| = \sqrt{1 - \sin A} \) or \( \sin \frac{A}{2} - \cos \frac{A}{2} = \pm \sqrt{1 - \sin A} \) i.e., \( +, \) if \( 2\pi + \pi / 4 \leq A / 2 \leq 2\pi + 5\pi / 4 \) \( - \), otherwise

(3) (i) \( \tan \frac{A}{2} = \pm \frac{\sqrt{\tan^2 A + 1} - 1}{\tan A} = \pm \frac{1 - \cos A}{\sin A} = \frac{1 - \cos A}{\sin A} \), where \( A \neq (2n + 1)\pi \)

(ii) \( \cot \frac{A}{2} = \pm \frac{1 + \cos A}{1 - \cos A} = \frac{1 + \cos A}{\sin A} \), where \( A \neq 2\pi \)
The ambiguities of signs are removed by locating the quadrants in which $\frac{A}{2}$ lies or you can follow the following figure,

(4) $\tan^2 \frac{A}{2} = \frac{1 - \cos A}{1 + \cos A}$, where $A \neq (2n+1)\pi$

(5) $\cot^2 \frac{A}{2} = \frac{1 + \cos A}{1 - \cos A}$, where $A \neq 2n\pi$

**Important Tips**

**Example: 43**

If $\sin \alpha = \frac{3}{5}$ where $\pi < \alpha < \frac{3\pi}{2}$, then $\cos \frac{\alpha}{2}$ equal to

(a) $\frac{1}{\sqrt{10}}$  
(b) $-\frac{1}{\sqrt{10}}$  
(c) $\frac{3}{\sqrt{10}}$  
(d) $-\frac{3}{\sqrt{10}}$

Solution: (d) $\pi < \alpha < \frac{3\pi}{2} \Rightarrow \frac{\pi}{2} < \frac{\alpha}{2} < \frac{3\pi}{4} \Rightarrow \cos \frac{\alpha}{2} = -ve \Rightarrow \therefore \cos \alpha = \frac{4}{5} \Rightarrow \cos \frac{\alpha}{2} = \sqrt{\frac{1 + \cos \alpha}{2}} = \sqrt{\frac{1 + \frac{4}{5}}{2}} = \frac{\sqrt{9}}{2} = -\frac{3}{\sqrt{10}}$.

**Example: 44**

$2\sin^2 \beta + 4\cos(\alpha + \beta)\sin \beta + \cos 2(\alpha + \beta)$ equal to

(a) $\sin 2\alpha$  
(b) $\cos 2\beta$  
(c) $\cos 2\alpha$  
(d) $\sin 2\beta$

Solution: (c) Since $2\cos(\alpha + \beta) = 2\cos^2(\alpha + \beta) - 1$, $2\sin^2 \beta = 1 - \cos 2\beta$, $-\cos 2\beta + 2\cos(\alpha + \beta)[2\sin \alpha \sin \beta + \cos(\alpha + \beta)] = -\cos 2\beta + 2\cos(\alpha + \beta)\cos(\alpha - \beta) = -\cos 2\beta + \cos 2\alpha + \cos 2\beta = \cos 2\alpha$.

**Example: 45**

$\frac{\cot^2 15^\circ - 1}{\cot^2 15^\circ + 1} =$
(a) $\frac{1}{2}$  
(b) $\frac{\sqrt{3}}{2}$  
(c) $\frac{3\sqrt{3}}{4}$  
(d) $\sqrt{3}$

**Solution:**

(b) 

$$1 - \tan^2 15 = \frac{1 - (\tan(45° - 30°))^2}{1 + \tan(45° - 30°)} = \left(1 - \frac{1 - \sqrt{3}}{1 + \sqrt{3}}\right)^2 = \left(\frac{\sqrt{3} + 1}{\sqrt{3} - 1}\right)^2 = \frac{\sqrt{3} + 1}{\sqrt{3} - 1} \cdot \frac{\sqrt{3} - 1}{\sqrt{3} - 1} = \frac{4\sqrt{3} + 2}{8} = \frac{\sqrt{3}}{2}$$

**Trick:** 

$$\cos 2\theta = \frac{1 - \tan^2 \theta}{1 + \tan^2 \theta} = \frac{1 - \tan^2 15°}{1 + \tan^2 15°} = \cos 30° = \frac{\sqrt{3}}{2}$$

**Example 46**

If \(\sin \theta = 32\cos^5 \theta \cdot \sin \theta - 32\cos^3 \theta \sin \theta + 3x\), then \(x = \)

(a) \(\cos \theta\)  
(b) \(\cos 2\theta\)  
(c) \(\sin \theta\)  
(d) \(\sin 2\theta\)

**Solution:**

(d) 

$$\sin \theta = 2\sin 3\theta \cdot \cos 3\theta = 2(3 \sin \theta - 4 \sin^3 \theta)(4 \cos^3 \theta - 3 \cos \theta)$$

$$= 24 \sin \theta \cdot \cos \theta (\sin^2 \theta + \cos^2 \theta) - 18 \sin \theta \cos \theta - 32 \sin^5 \theta \cos^3 \theta = 32 \cos^3 \theta \cdot \sin \theta - 32 \cos^3 \theta \cdot \sin \theta + 3 \sin 2\theta$$

On comparing, \(x = \sin 2\theta\)

**Trick:** 

Put \(\theta = 0°\), then \(x = 0\). So, option (a) and (d) are correct.

Now put \(\theta = 30°\), then \(x = \frac{\sqrt{3}}{2}\). Therefore, Only option (d) is correct.

**Example 47**

If \(\sqrt{x + \frac{1}{\sqrt{x}}} = 2 \cos \theta\), then \(x^6 + x^{-4} = \)

(a) \(2 \cos 6\theta\)  
(b) \(2 \cos 12\theta\)  
(c) \(2 \cos 3\theta\)  
(d) \(2 \sin 3\theta\)

**Solution:**

(b) 

Given, \(\sqrt{x + \frac{1}{\sqrt{x}}} = 2 \cos \theta\)  

On squaring both sides we get, \(x + \frac{1}{x} + 2 = 4 \cos^2 \theta \Rightarrow x + \frac{1}{x} = 4 \cos^2 \theta - 2\)

\(\Rightarrow x + \frac{1}{x} = 2(2 \cos^2 \theta - 1) = 2 \cos 2\theta\)  

Again squaring both sides,

\(x^2 + \frac{1}{x^2} + 2 = 4 \cos^2 2\theta \Rightarrow x^2 + \frac{1}{x^2} = 4 \cos^2 2\theta - 2 = 2(2 \cos^2 2\theta - 1) \Rightarrow x^2 + \frac{1}{x^2} = 2 \cos 4\theta\)  

Now taking cube of both sides, 

\(\left(x^2 + \frac{1}{x^2}\right)^3 = (2 \cos 4\theta)^3 \Rightarrow x^6 + \frac{1}{x^6} + 3x^2 \cdot \frac{1}{x^2} \left(x^2 + \frac{1}{x^2}\right) = 8 \cos^3 4\theta\)

\(\Rightarrow x^6 + \frac{1}{x^6} + 3(2 \cos 4\theta) = 8 \cos^3 4\theta \Rightarrow x^6 + \frac{1}{x^6} = 8 \cos^3 4\theta - 6 \cos 4\theta\)

\(\Rightarrow x^6 + \frac{1}{x^6} = 2(4 \cos^3 4\theta - 3 \cos 4\theta) = 2 \cos 3(4\theta) = 2 \cos 12\theta\).

**Example 48**

For \(A = 133°\), \(2 \cos \frac{A}{2}\) is equal to

(a) \(-\sqrt{1 + \sin A} - \sqrt{1 - \sin A}\)
(b) \(-\sqrt{1 + \sin A} + \sqrt{1 - \sin A}\)
(c) \(\sqrt{1 + \sin A} - \sqrt{1 - \sin A}\)
(d) \(\sqrt{1 + \sin A} + \sqrt{1 - \sin A}\)

Solution: (c) For \(A = 133.5^\circ\),
\[\sin \frac{A}{2} > \cos \frac{A}{2} > 0\]
Hence, \(\sqrt{1 + \sin A} = \sin \frac{A}{2} + \cos \frac{A}{2}\) \((\text{i})\) and \(\sqrt{1 - \sin A} = \sin \frac{A}{2} - \cos \frac{A}{2}\) \((\text{ii})\)

Subtract (ii) from (i) we get,
\[2\cos^2 \frac{A}{2} - 2\sin \frac{A}{2} \cos \frac{A}{2} = 0\]

Example: 49
If \(2\tan A = 3\tan B\), then \(\frac{\sin 2B}{5 - \cos 2B}\) is equal to
(a) \(\tan A - \tan B\)
(b) \(\tan(A - B)\)
(c) \(\tan(A + B)\)
(d) \(\tan(A + 2B)\)

Solution: (b) \(2\tan A = 3\tan B \Rightarrow \tan A = \frac{3}{2}\tan B = \frac{3B}{2}\)

Example: 50
If \(90^\circ < A < 180^\circ\) and \(\sin A = \frac{4}{5}\), then \(\tan \frac{A}{2}\) is equal to
(a) \(\frac{1}{2}\)
(b) \(\frac{3}{5}\)
(c) \(\frac{3}{2}\)
(d) \(2\)

Solution: (d) \(\sin A = \frac{4}{5} \Rightarrow \tan A = -\frac{4}{3}\) \((90^\circ < A < 180^\circ)\)
\[\tan A = \frac{2\tan \frac{A}{2}}{1 - \tan^2 \frac{A}{2}}\]
\[\Rightarrow \frac{4}{3} = \frac{2P}{1 - P^2} \Rightarrow 4P^2 - 6P - 4 = 0 \Rightarrow P = \frac{-1 \pm \sqrt{1 + 4}}{2} = \frac{1}{2}, 2 \Rightarrow P = \frac{1}{2}\) (impossible)

\[\tan \frac{A}{2} = 2\]

Example: 51
If \(\tan \alpha = \frac{1}{7}\) and \(\sin \beta = \frac{1}{\sqrt{10}}\), then \(\tan(\alpha + 2\beta)\) is equal to
(a) \(1\)
(b) \(0\)
(c) \(\frac{1}{2}\)
(d) \(\frac{3}{4}\)

Solution: (a) \(\tan \alpha = \frac{1}{7}, \sin \beta = \frac{1}{\sqrt{10}} \Rightarrow \tan \beta = \frac{1}{3} \Rightarrow \tan 2\beta = \frac{2}{1 - \frac{1}{9}} = \frac{3}{4}\)
\[ \tan(\alpha + 2\beta) = \frac{1 + \frac{3}{4}}{1 - \frac{3}{28}} = \frac{4 + 21}{25} = 1 \]

**Example: 52** If \( \tan \frac{\theta}{2} = t \), then \( \frac{1 - t^2}{1 + t^2} \) is equal to

(a) \( \cos \theta \)  
(b) \( \sin \theta \)  
(c) \( \sec \theta \)  
(d) \( \cos 2\theta \)

**Solution:**

\[ \frac{1 - t^2}{1 + t^2} = \frac{1 - \tan^2 \frac{\theta}{2}}{1 + \tan^2 \frac{\theta}{2}} \]

\( \therefore \tan \frac{\theta}{2} = t \)  
\( \Rightarrow \cos(\theta) = \cos(\theta) \)

**Example: 53** The value of \( \frac{\tan x}{\tan 3x} \) when ever defined never lie between

(a) \( \frac{1}{3} \) and 3  
(b) \( \frac{1}{4} \) and 4  
(c) \( \frac{1}{5} \) and 5  
(d) 5 and 6

**Solution:**

\( y = \frac{\tan x}{\tan 3x} = \frac{\tan x}{3\tan x - \tan^3 x} = \frac{1 - 3\tan^2 x}{3\tan^2 x - 1} \)

Hence, \( y \) should never lie between \( \frac{1}{3} \) and 3 whenever defined.

**Example: 54** If \( \tan \theta = t \), then \( \tan 2\theta + \sec 2\theta \) equal to

(a) \( \frac{1 + t}{1 - t} \)  
(b) \( \frac{1 - t}{1 + t} \)  
(c) \( \frac{2t}{1 - t} \)  
(d) \( \frac{2t}{1 + t} \)

**Solution:**

\( \tan 2\theta + \sec 2\theta = \frac{2\tan \theta}{1 - \tan^2 \theta} + \frac{1 + \tan^2 \theta}{1 - \tan^2 \theta} \)

Given \( \tan \theta = t \)  
\( \Rightarrow \tan 2\theta + \sec 2\theta = \frac{2t}{1 - t^2} + \frac{1 + t^2}{1 - t^2} = \frac{2t + 1 + t^2}{1 - t^2} = \frac{(1 + t)^2}{1 - t^2} = \frac{1 + t}{1 - t} \).

**Example: 55** If \( \sin 2\theta + \cos 2\theta = \frac{1}{2} \) and \( \cos 2\theta + \cos 2\theta = \frac{3}{2} \), then \( \cos^2 (\theta - \phi) \) equal to

(a) \( \frac{3}{8} \)  
(b) \( \frac{5}{8} \)  
(c) \( \frac{3}{4} \)  
(d) \( \frac{5}{4} \)

**Solution:**

Given, \( \sin 2\theta + \sin 2\theta = \frac{1}{2} \)  
\( \cos 2\theta + \cos 2\theta = \frac{3}{2} \)

Squaring and adding,  
\( : (\sin^2 2\theta + \cos^2 2\theta) + (\sin^2 2\theta + \cos^2 2\theta) + 2(\sin 2\theta \cdot \sin 2\theta + \cos 2\theta \cdot \cos 2\theta) = \frac{1}{4} + \frac{9}{4} \)

\( \Rightarrow \cos 2\theta \cdot \cos 2\theta + \sin 2\theta \cdot \sin 2\theta = \frac{1}{4} \Rightarrow \cos(2\theta - 2\phi) = \frac{1}{4} \Rightarrow \cos^2 (\theta - \phi) = \frac{5}{8} \).

**Example: 56** If \( \tan x = \frac{b}{a} \) then \( \sqrt{\frac{a + b}{a - b}} + \sqrt{\frac{a - b}{a + b}} \) equal to

(a) \( \frac{2 \sin x}{\sqrt{\sin 2x}} \)  
(b) \( \frac{2 \cos x}{\sqrt{\cos 2x}} \)  
(c) \( \frac{2 \cos x}{\sqrt{\sin 2x}} \)  
(d) \( \frac{2 \sin x}{\sqrt{\cos 2x}} \)
Solution: (b) Given \( \tan x = \frac{b}{a} \) \( \Rightarrow \frac{a+b}{a-b} + \frac{a-b}{a+b} = \frac{1+b/a}{1-b/a} + \frac{1-b/a}{1+b/a} = \frac{1 + \tan x}{1 - \tan x} + \frac{1 - \tan x}{1 + \tan x} = \frac{2}{1 - \tan^2 x} \)

Now, multiplying by \( \sqrt{1 + \tan^2 x} \) in \( Nr \) and \( Dr \) equals \( \frac{2}{\sqrt{1 - \tan^2 x} \sqrt{1 + \tan^2 x}} = \frac{2}{\sqrt{\cos 2x \sec^2 x}} = \frac{2 \cos x}{\cos 2x} \).

1.14 Maximum and Minimum Value of \( a \cos \theta + b \sin \theta \)

Let \( a = r \cos \alpha \) .......(i) and \( b = r \sin \alpha \) .......(ii)

Squaring and adding (i) and (ii), then \( a^2 + b^2 = r^2 \) or \( r = \sqrt{a^2 + b^2} \)

\[ \therefore a \sin \theta + b \cos \theta = r(\sin \theta \cos \alpha + \cos \theta \sin \alpha) = r \sin(\theta + \alpha) \]

But \(-1 \leq \sin \theta < 1 \) So, \(-1 \leq \sin(\theta + \alpha) \leq 1 \); Then \(-r \leq r \sin(\theta + \alpha) \leq r \)

Hence, \(-\sqrt{a^2 + b^2} \leq a \sin \theta + b \cos \theta \leq \sqrt{a^2 + b^2} \)

Then the greatest and least values of \( a \sin \theta + b \cos \theta \) are respectively \( \sqrt{a^2 + b^2} \) and \(-\sqrt{a^2 + b^2} \).

\[ \text{Note:} \quad \sin^2 x + \cosec^2 x \geq 2, \text{ for every real } x. \]

\[ \cos^2 x + \sec^2 x \geq 2, \text{ for every real } x. \]

\[ \tan^2 x + \cot^2 x \geq 2, \text{ for every real } x. \]

\begin{center}
**Important Tips**
\end{center}

\textbf{Use of } \Sigma \textbf{ (Sigma) and } \Pi \textbf{ (Pie) notation}

\begin{itemize}
  \item \( \sin(A + B + C) = \Sigma \sin A \cos B \cos C - \Pi \sin A \), \( \cos(A + B + C) = \Pi \cos A - \Sigma \cos A \sin B \sin C \),
  \item \( \tan(A + B + C) = \frac{\Sigma \tan A - \Pi \tan A}{1 - \Sigma \tan A \tan B} \) \( (\because \Sigma \text{ denotes summation}) \)
  \item \( \sin \alpha + \sin(\alpha + \beta) + \sin(\alpha + 2\beta) + \ldots \text{n terms} \)
    \[ = \frac{\sin(\alpha + (n-1)\beta / 2) \sin(n\beta / 2)}{\sin(\beta / 2)} \quad \text{or} \quad \sum_{r=1}^{n} \sin(A + r \beta) = \frac{\sin(A + \frac{n-1}{2} \beta) \sin \frac{n\beta}{2}}{\sin \frac{\beta}{2}}. \]
  \item \( \cos \alpha + \cos(\alpha + \beta) + \cos(\alpha + 2\beta) + \ldots \text{n terms} \)
    \[ = \frac{\cos[\alpha + (n-1)\beta / 2] \sin(n\beta / 2)}{\sin(\beta / 2)} \quad \text{or} \quad \sum_{r=1}^{n} \cos(A + r \beta) = \frac{\cos(A + \frac{n-1}{2} \beta) \sin \frac{n\beta}{2}}{\sin \frac{\beta}{2}}. \]
  \item \( \sin A / 2 \pm \cos A / 2 = \sqrt{\sin[\frac{A + \pi / 4 \pm A]}{\cos[A + \pi / 4]}. \}
  \item \( \cos \alpha + \cos \beta + \cos \gamma + \cos(\alpha + \beta + \gamma) = 4 \cos \frac{\alpha + \beta}{2} \cos \frac{\beta + \gamma}{2} \cos \frac{\gamma + \alpha}{2}. \)
  \item \( \sin \alpha + \sin \beta + \sin \gamma - \sin(\alpha + \beta + \gamma) = 4 \sin \frac{\alpha + \beta}{2} \sin \frac{\beta + \gamma}{2} \sin \frac{\gamma + \alpha}{2}. \)
  \item \( \tan \alpha + 2 \tan 2x + 4 \tan 4x + 8 \tan 8x = \cot \alpha . \)
\end{itemize}

\textbf{Example: 57} \quad \text{If } x = y \cos \frac{2\pi}{3} = z \cos \frac{4\pi}{3}, \text{ then } xy + yz + zx = \]

\begin{itemize}
  \item [(a)] -1
  \item [(b)] 0
  \item [(c)] 1
  \item [(d)] 2
\end{itemize}
Solution: (b) We have \( \frac{x}{1} = \frac{y}{-2} = \frac{z}{-2} = \lambda \) (say)

\[
\therefore \ x = \lambda \ , \ y = -2\lambda , \ z = -2\lambda \\
\therefore \ xy + yz + zx = -2\lambda^2 + 4\lambda^2 - 2\lambda^2 = 0
\]

Example: 58

\[
\text{sec} 8A - 1 \text{ equal to to} \frac{\tan 2A}{\tan 8A} (a) \ \frac{\tan 2A}{\tan 8A} \quad (b) \ \frac{\tan 8A}{\tan 2A} \quad (c) \ \frac{\cot 8A}{\cot 2A} \quad (d) \ \text{None of these}
\]

Solution: (b)

\[
\frac{1 - \cos 8A}{\cos 8A} \frac{\cos 4A}{1 - \cos 4A} = \frac{2\sin^2 4A}{\cos 8A} = \frac{2\sin 4A \cos 4A}{\cos 8A} = \frac{2\sin 8A \cos 4A}{2\sin^2 2A} = \frac{\sin 8A}{\cos 8A} \frac{2\sin 2A}{2\sin^2 2A} = \frac{\tan 8A}{\tan 2A}.
\]

Example: 59

If \( \tan\theta = \frac{a}{b} \) then \( \frac{\sin\theta}{\cos\theta} + \frac{\cos\theta}{\sin\theta} \) equal to

\[
(a) \ \pm \frac{(a^2 + b^2)^{\frac{3}{2}}}{\sqrt{a^2 + b^2}} \left[ \frac{a}{b} + \frac{b}{a} \right] \\
(b) \ \pm \frac{(a^2 + b^2)^{\frac{3}{2}}}{\sqrt{a^2 + b^2}} \left[ \frac{a}{b} - \frac{b}{a} \right] \\
(c) \ \pm \frac{(a^2 - b^2)^{\frac{3}{2}}}{\sqrt{a^2 + b^2}} \left[ \frac{a}{b} + \frac{b}{a} \right] \\
(d) \ \pm \frac{(a^2 - b^2)^{\frac{3}{2}}}{\sqrt{a^2 + b^2}} \left[ \frac{a}{b} - \frac{b}{a} \right]
\]

Solution: (a)

Given, \( \tan\theta = a/b \Rightarrow \cos 2\theta = \frac{1 - \tan^2 \theta}{1 + \tan^2 \theta} = \frac{b^2 - a^2}{b^2 + a^2} \)

\[
\sin\theta = \pm \frac{a}{\sqrt{a^2 + b^2}}; \ \cos\theta = \pm \frac{b}{\sqrt{a^2 + b^2}}
\]

\[
\frac{\sin\theta}{\cos\theta} = \frac{a}{\sqrt{a^2 + b^2}} \frac{b}{a} + \frac{b}{\sqrt{a^2 + b^2}} = \frac{a^2 + b^2)^{\frac{3}{2}}}{b^2 + b^2} \left[ \frac{a}{b} + \frac{b}{a} \right] = \frac{a^2 + b^2)^{\frac{3}{2}}}{b^2 + b^2} \left[ \frac{a}{b} + \frac{b}{a} \right]
\]

Example: 60

The minimum value of \( 3 \cos x + 4 \sin x + 5 = \)

(a) 5 \quad (b) 9 \quad (c) 7 \quad (d) 0

Solution: (d)

Minimum value of \( 3 \cos x + 4 \sin x = -\sqrt{3^2 + 4^2} = -5 \)

Minimum value of \( 3 \cos x + 4 \sin x + 5 = -5 + 5 = 0 \)

Example: 61

The greatest and least value of \( \sin x \cos x \) are

(a) \( 1, -1 \) \quad (b) \( \frac{1}{2}, -\frac{1}{2} \) \quad (c) \( \frac{1}{4}, -\frac{1}{4} \) \quad (d) \( 2, -2 \)

Solution: (b)

\[
\frac{1}{2} [2 \sin x \cos x] = \frac{1}{2} \sin 2x; \quad -1 \leq \sin 2x \leq 1; \quad -\frac{1}{2} \leq \sin 2x \leq \frac{1}{2}
\]

Example: 62

The value of \( \sin \theta + \cos \theta \) will be greatest when

(a) \( \theta = 30^\circ \) \quad (b) \( \theta = 45^\circ \) \quad (c) \( \theta = 60^\circ \) \quad (d) \( \theta = 90^\circ \)

Solution: (b)

Let \( f(x) = \sin \theta + \cos \theta = \sqrt{2} \sin \left( \theta + \frac{\pi}{4} \right) \)

\[
-1 \leq \sin \theta + \frac{\pi}{4} \leq 1 \Rightarrow -\sqrt{2} \leq \sqrt{2} \sin \theta + \frac{\pi}{4} \leq \sqrt{2}
\]
If \( f(x) \) is maximum then,
\[
\sin(\theta + \frac{\pi}{4}) = 1 = \sin(\frac{\pi}{2}) \Rightarrow \theta = \frac{\pi}{4} \Rightarrow \theta - \frac{\pi}{4} = \theta - \frac{\pi}{4}
\]

**Example: 63**
The maximum value of \( \sin^2 x + 3\cos^2 x \) is
(a) \( 3 \) \hspace{1cm} (b) \( 4 \) \hspace{1cm} (c) \( 5 \) \hspace{1cm} (d) \( 7 \)

**Solution:**

\( f(x) = 4\sin^2 x + 3\cos^2 x = \sin^2 x + 3 \) and \( 0 \leq |\sin x| \leq 1 \)

Max. Maximum value of \( \sin^2 x + 3\cos^2 x \) is 4.

**Example: 64**
If \( A = \cos^2 \theta + \sin^4 \theta \), then for all values of \( \theta \)

(a) \( 1 \leq A \leq 2 \) \hspace{1cm} (b) \( \frac{13}{16} \leq A \leq 1 \) \hspace{1cm} (c) \( \frac{3}{4} \leq A \leq \frac{13}{16} \) \hspace{1cm} (d) \( \frac{3}{4} \leq A \leq 1 \)

**Solution:**

\( A = \cos^2 x + \sin^4 x \Rightarrow \cos^2 \theta + \sin^2 \theta \sin^2 \theta \)

\( \Rightarrow A \leq \cos^2 \theta + \sin^2 \theta \) \hspace{1cm} \( \text{[} \therefore \sin^2 \theta \leq 1 \text{]} \Rightarrow A \leq 1 \)

Again \( A = \cos^2 \theta + \sin^4 \theta = (1 - \sin^2 \theta) + \sin^4 \theta \)

\[ A = \left( \sin^2 \theta - \frac{1}{2} \right)^3 + \frac{3}{4} \geq \frac{3}{4} \]

Hence, \( \frac{3}{4} \leq A \leq 1 \).

**Example: 65**
The value of \( 5\cos \theta + 3\cos \theta + \frac{\pi}{3} \) lies between

(a) \( -4 \) and \( 4 \) \hspace{1cm} (b) \( -4 \) and \( 6 \) \hspace{1cm} (c) \( -4 \) and \( 8 \) \hspace{1cm} (d) \( -4 \) and \( 10 \)

**Solution:**

\[ 5\cos \theta + 3\cos \theta + \frac{\pi}{3} + 3 = 5\cos \theta + 3[\cos \theta \cos \frac{\pi}{3} - \sin \theta \sin \frac{\pi}{3}] + 3 \]

\[ = [5\cos \theta + \frac{3}{2}\cos \theta - \frac{3\sqrt{3}}{2}\sin \theta] + 3 = \left( \frac{13}{2}\cos \theta - \frac{3\sqrt{3}}{2}\sin \theta \right) + 3 \]

\[ \therefore - \left( \frac{13}{2}\cos \theta - \frac{3\sqrt{3}}{2}\sin \theta \right) \leq 3 \leq \left( \frac{13}{2}\cos \theta - \frac{3\sqrt{3}}{2}\sin \theta \right) \]

\[ -7 \leq -7 + 3 \leq \left( \frac{13}{2}\cos \theta - \frac{3\sqrt{3}}{2}\sin \theta \right) + 3 \leq 7 \]

So, the value lies between \( -4 \) and \( 10 \).

**Example: 66**
\( \sin \frac{\pi}{14}, \sin \frac{3\pi}{14}, \sin \frac{5\pi}{14}, \sin \frac{7\pi}{14}, \sin \frac{9\pi}{14}, \sin \frac{11\pi}{14}, \sin \frac{13\pi}{14} \) is equal to

(a) \( \frac{1}{8} \) \hspace{1cm} (b) \( \frac{1}{16} \) \hspace{1cm} (c) \( \frac{1}{32} \) \hspace{1cm} (d) \( \frac{1}{64} \)
1.15 Conditional Trigonometrical Identities

We have certain trigonometric identities. Like, \( \sin^2\theta + \cos^2\theta = 1 \) and \( 1 + \tan^2\theta = \sec^2\theta \) etc.

Such identities are identities in the sense that they hold for all value of the angles which satisfy the given condition among them and they are called conditional identities.

If \( A, B, C \) denote the angles of a triangle \( ABC \), then the relation \( A + B + C = \pi \) enables us to establish many important identities involving trigonometric ratios of these angles.

1. If \( A + B + C = \pi \), then \( A + B = \pi - C, B + C = \pi - A \) and \( C + A = \pi - B \).
2. If \( A + B + C = \pi \), then \( \sin(A + B) = \sin(\pi - C) = \sin C \).
Similarly, \( \sin(B + C) = \sin(\pi - A) = \sin A \) and \( \sin(C + A) = \sin(\pi - B) = \sin B \)

(3) If \( A + B + C = \pi \), then \( \cos(A + B) = \cos(\pi - C) = -\cos C \)

Similarly, \( \cos(B + C) = \cos(\pi - A) = -\cos A \) and \( \cos(C + A) = \cos(\pi - B) = -\cos B \)

(4) If \( A + B + C = \pi \), then \( \tan(A + B) = \tan(\pi - C) = -\tan C \)

Similarly, \( \tan(B + C) = \tan(\pi - A) = -\tan A \) and \( \tan(C + A) = \tan(\pi - B) = -\tan B \)

(5) If \( A + B + C = \pi \), then

\[
\begin{align*}
\sin\left(\frac{A + B}{2}\right) &= \sin\left(\frac{\pi - C}{2}\right) = \cos\left(\frac{C}{2}\right), \\
\cos\left(\frac{A + B}{2}\right) &= \cos\left(\frac{\pi - C}{2}\right) = \sin\left(\frac{C}{2}\right).
\end{align*}
\]

\[
\tan\left(\frac{A + B}{2}\right) = \tan\left(\frac{\pi - C}{2}\right) = \cot\left(\frac{C}{2}\right).
\]

All problems on conditional identities are broadly divided into the following three types

1. **Identities involving sine and cosine of the multiple or sub-multiple of the angles involved**

   **Working Method**

   **Step** (i) : Use \( C \pm D \) formulae.

   **Step** (ii) : Use the given relation \( (A + B + C = \pi) \) in the expression obtained in step-(i) such that a factor can be taken common after using multiple angles formulae in the remaining term.

   **Step** (iii) : Take the common factor outside.

   **Step** (iv) : Again use the given relation \( (A + B + C = \pi) \) within the bracket in such a manner so that we can apply \( C \pm D \) formulae.

   **Step** (v) : Find the result according to the given options.

2. **Identities involving squares of sine and cosine of multiple or sub-multiples of the angles involved**

   **Working Method**

   **Step** (i) : Arrange the terms of the identity such that either \( \sin^2 A - \sin^2 B = \sin(A + B)\cdot \sin(A - B) \) or \( \cos^2 A - \sin^2 B = \cos(A + B)\cdot \cos(A - B) \) can be used.

   **Step** (ii) : Take the common factor outside.

   **Step** (iii) : Use the given relation \( (A + B + C = \pi) \) within the bracket in such a manner so that we can apply \( C \pm D \) formulae.

   **Step** (iv) : Find the result according to the given options.

3. **Identities for tangent and cotangent of the angles**

   **Working Method**
Step (i): Express the sum of the two angles in terms of third angle by using the given relation \((A + B + C = \pi)\).

Step (ii): Taking tangent or cotangent of the angles of both the sides.

Step (iii): Use sum and difference formulae in the left hand side.

Step (iv): Use cross multiplication in the expression obtained in the step (iii).

Step (v): Arrange the terms as per the result required.

Example: 69

If \(A + B + C = \pi\), then \(\cos^2 A + \cos^2 B - \cos^2 C\) equal to

(a) \(1 - 2 \sin A \sin B \cos C\)
(b) \(1 - 2 \cos A \cos B \sin C\)
(c) \(1 + 2 \sin A \sin B \cos C\)
(d) \(1 + 2 \cos A \cos B \sin C\)

Solution: (a) \(\cos^2 A + \cos^2 B - \cos^2 C = \cos^2 A + (1 - \sin^2 B) - \cos^2 C\)

\[= 1 + [\cos^2 A - \sin^2 B] - \cos^2 C = 1 + \cos(A + B) \cos(A - B) - \cos^2 C\]

\[= 1 + \cos C[\cos(A - B) + \cos(\pi - (A + B))] = 1 - \cos C[\cos(A - B) + \cos(A + B)]\]

\[= 1 - \cos C[2 \sin A \sin B] = 1 - 2 \sin A \sin B \cos C\]

Example: 70

\(\sin 2A + \sin 2B - \sin 2C\) \(\sin A + \sin B - \sin C\) equal to

(a) \(\frac{\cos A \cos B \sin C}{\sin^2 \frac{A - B}{2}} - \cos^2 \frac{A + B}{2}\)
(b) \(\frac{\sin A \sin B \cos C}{\cos^2 \frac{A - B}{2}} - \sin^2 \frac{A + B}{2}\)
(c) \(- \cos A \cos B \sin C\)
(d) \(- \sin A \sin B \cos C\)

Solution: (a) \(\frac{\sin 2A + \sin 2B - \sin 2C}{\sin A + \sin B - \sin C} = \frac{2 \sin(A + B) \cos(A - B) - \sin 2C}{2 \sin \left(\frac{A + B}{2}\right) \cos \left(\frac{A - B}{2}\right) - \sin C}\)

\[= \frac{2 \sin C[\cos(A - B) - \cos C]}{2 \cos \left(\frac{A + B}{2}\right) \cos \left(\frac{A - B}{2}\right) - \cos^2 \frac{A + B}{2}}\]

\[= \frac{2 \sin C[\cos(A - B) + \cos(A + B)]}{2 \cos \left(\frac{A + B}{2}\right) \cos \left(\frac{A - B}{2}\right) - \cos^2 \frac{A + B}{2}} = \frac{2 \sin C[2 \cos A \cos B]}{2 \cos \left(\frac{A + B}{2}\right) \cos \left(\frac{A - B}{2}\right) - \cos^2 \frac{A + B}{2}} = \cos A \cos B \sin C\]

Trick: \(\therefore \sin 2A + \sin 2B - \sin 2C = 4 \cos A \cos B \sin C\)

and \(\sin A + \sin B - \sin C = 4 \sin \frac{A}{2} \sin \frac{B}{2} \sin C \\Rightarrow \frac{\sin 2A + \sin 2B - \sin 2C}{\sin A + \sin B - \sin C} = \frac{\cos A \cos B \sin C}{\sin \frac{A}{2} \sin \frac{B}{2} \sin C}\)

Example: 71

If \(\alpha + \beta + \gamma = 2\pi\), then

(a) \(\tan \frac{\alpha}{2} + \tan \frac{\beta}{2} + \tan \frac{\gamma}{2} = \tan \frac{\alpha}{2} \tan \frac{\beta}{2} \tan \frac{\gamma}{2}\)
(b) \(\tan \frac{\alpha}{2} \tan \frac{\beta}{2} + \tan \frac{\gamma}{2} \tan \frac{\gamma}{2} \tan \frac{\alpha}{2} = 1\)
(c) \(\tan \frac{\alpha}{2} + \tan \frac{\beta}{2} + \tan \frac{\gamma}{2} = - \tan \frac{\alpha}{2} \tan \frac{\beta}{2} \tan \frac{\gamma}{2}\)
(d) None of these

Solution: (a) We have \(\alpha + \beta + \gamma = 2\pi \Rightarrow \frac{\alpha}{2} + \frac{\beta}{2} + \frac{\gamma}{2} = \pi \Rightarrow \tan \left(\frac{\alpha}{2} + \frac{\beta}{2} + \frac{\gamma}{2}\right) = \tan \pi = 0\)
Example: 72
If \(A + B + C = \pi\), then \(\cos 2A + \cos 2B + \cos 2C\) equal to
(a) \(1 + 4 \cos A \cos B \sin C\)
(b) \(-1 + 4 \sin A \sin B \cos C\)
(c) \(-1 - 4 \cos A \cos B \cos C\)
(d) None of these

Solution: (c) \(\cos 2A + \cos 2B + \cos 2C = 2 \cos(A+B) \cos(A-B) + (2 \cos^2 C - 1) = -1 - 2 \cos C \cos(A+B) + 2 \cos^2 C\)

Example: 73
If \(A + B + C = 180^\circ\), then \(\sin 2A + \sin 2B + \sin 2C\) equal to
(a) \(8 \sin A \sin B \sin C\)
(b) \(8 \cos A \cos B \cos C\)
(c) \(8 \sin A \cos B \cos C\)
(d) \(8 \cos A \sin B \sin C\)

Solution: (b) \(\frac{\sin 2A + \sin 2B + \sin 2C}{\cos A + \cos B + \cos C - 1} = 2 \frac{\sin(A+B) \cos(A-B) + \sin C \cos C}{2 \cos A + B + 1 - 2 \sin^2 C - 1} = \frac{2 \sin C \cos(A-B) + 2 \cos C \sin C}{2 \cos A + B - 2 \sin^2 C - 2}\)

Example: 74
If \(A + B + C = 180^\circ\), then the value of \((\cot B + \cot C) (\cot C + \cot A) (\cot A + \cot B)\) will be
(a) \(\sec A \sec B \sec C\)
(b) \(\cosec A \cosec B \cosec C\)
(c) \(\tan A \tan B \tan C\)
(d) 1

Solution: (b) \(\cot B + \cot C = \frac{\sin B \cos C + \sin C \cos B}{\sin B \sin C} = \frac{\sin(B+C)}{\sin B \sin C} = \frac{\sin(180^\circ - A)}{\sin B \sin C} = \frac{\sin A}{\sin B \sin C}\)

Similarly, \(\cot C + \cot A = \frac{\sin C \sin A}{\sin C \sin A} = \frac{\sin C}{\sin A \sin B}\)

Therefore, \((\cot B + \cot C) (\cot C + \cot A) (\cot A + \cot B) = \frac{\sin A}{\sin B \sin C} \cdot \frac{\sin C}{\sin A \sin B} = \cosec A \cosec B \cosec C\).

Example: 75
If \(A + B + C = 180^\circ\), then the value of \(\frac{A}{2} + \frac{B}{2} + \frac{C}{2}\) will be
(a) \(2 \cot A \cot B \cot C\)
(b) \(4 \cot A \cot B \cot C\)
(c) \(\frac{A}{2} \cot B \cot C\)
(d) \(8 \cot A \cot B \cot C\)

Solution: (c) \(A + B + C = 180^\circ \Rightarrow \frac{A}{2} + \frac{B}{2} + \frac{C}{2} = 90^\circ - \frac{C}{2}\)

\:. \(\cot \left(\frac{A}{2} + \frac{B}{2}\right) = \cot \left(90^\circ - \frac{C}{2}\right)\) or \(\cot \frac{A}{2} \cdot \cot \frac{B}{2} = 1 = \cot \frac{C}{2}\)

or \(\cot \frac{A}{2} \cdot \cot \frac{B}{2} = 1 \Rightarrow \cot \frac{C}{2} = \frac{\cot A}{2} \cdot \cot \frac{B}{2} + \cot \frac{A}{2} \cdot \cot \frac{C}{2} + \cot \frac{B}{2} + \cot \frac{A}{2}\)
Example: 76  If A, B, C are angles of a triangle, then sin 2A + sin 2B – sin 2C is equal to
(a) 4 sin A cos B cos C  (b) 4 cos A  (c) 4 sin A cos A  (d) 4 cos A cos B sin C

Solution: (d) sin 2A + sin 2B – sin 2C = 2 sin A cos A + 2 cos(B + C)sin(B – C)

Trick: First put A = B = C = 60°, for these values. Options (a) and (b) satisfies the condition.
Now put A = B = 45° and C = 90°, then only (d) satisfies.

Hence (d) is the answer.

Example: 77  In any triangle \(ABC\), \(\sin^2 A + \sin^2 B + \sin^2 C\) is equal to
(a) \(1 - 2 \cos A \cos B \cos C\)  (b) \(1 - 2 \sin A \cos B \cos C\)
(c) \(1 - 2 \sin A \sin B \sin C\)  (d) \(1 - 2 \cos A \cos B \sin C\)

Solution: (c)  For \(A = B = C = 60°\) only option (c) satisfies the condition.

---

**Important Tips**

### Method of Componendo and Dividendo

If \(\frac{a}{b} = \frac{c}{d}\), then by componendo and dividendo

We can write \(\frac{a+b}{a-b} = \frac{c+d}{c-d}\) or \(\frac{a+b}{b-a} = \frac{c+d}{c-d}\) or \(\frac{p+q}{p-q} = \frac{a+b}{a-b}\) or \(\frac{q-p}{q+p} = \frac{b-a}{b+a}\).

Example: 78  If \(\tan \beta = \cos \theta, \tan \alpha\) then \(\tan \frac{\alpha}{2}\) equal to

(a) \(\frac{\sin(\alpha - \beta)}{\sin(\alpha + \beta)}\)  (b) \(\frac{\sin(\alpha + \beta)}{\sin(\alpha - \beta)}\)
(c) \(\frac{\cos(\alpha - \beta)}{\cos(\alpha + \beta)}\)  (d) \(\frac{\cos(\alpha + \beta)}{\cos(\alpha - \beta)}\)

Solution: (a)  The given relation is \(\frac{\tan \alpha}{\tan \beta} = \frac{1}{\cos \theta}\)

Applying componendo and dividendo rule, then

\[\frac{\tan \alpha - \tan \beta}{\tan \alpha + \tan \beta} = \frac{1 - \cos \theta}{1 + \cos \theta} \Rightarrow \frac{\sin(\alpha - \beta)}{\sin(\alpha + \beta)} = \frac{2\sin^2 \frac{\theta}{2}}{2\cos^2 \frac{\theta}{2}} \Rightarrow \frac{\sin(\alpha - \beta)}{\sin(\alpha + \beta)} = \tan^2 \frac{\theta}{2}.

Example: 79  If \(m \cos \theta + \alpha = n \cos(\theta - \alpha)\), then \(\cot \theta \cos \alpha\) equal to

(a) \(\frac{m+n}{m-n}\)  (b) \(\frac{m-n}{m+n}\)
(c) \(\frac{m+n}{n-m}\)  (d) \(\frac{n-m}{n+m}\)

Solution: (c)  By componendo and dividendo rule, \(\frac{m+n}{m-n} = \frac{\cos(\theta - \alpha) + \cos(\theta + \alpha)}{\cos(\theta - \alpha) - \cos(\theta + \alpha)} \Rightarrow \frac{m+n}{m-n} = \frac{2 \cos \theta \cos \alpha}{-2 \sin \theta \sin \alpha}.

Pratap Bhawan, Behind Leela Cinema, Hazrat Ganj, Lucknow

cot \theta \cos \alpha = \frac{m+n}{n-m}.

**Example: 80**

If \cosec \theta = \frac{p+q}{p-q}, then \cot \left( \frac{\pi}{4} + \frac{\theta}{2} \right) = \frac{\sqrt{p}}{\sqrt{q}}.

(a) \sqrt{\frac{p}{q}} \quad (b) \sqrt{\frac{q}{p}} \quad (c) \sqrt{pq} \quad (d) pq

**Solution: (b)**

Given, \cosec \theta = \frac{p+q}{p-q} \Rightarrow \frac{1}{\sin \theta} = \frac{p+q}{p-q},

Apply componendo and dividendo, \frac{1+\sin \theta}{1-\sin \theta} = \frac{p+q+p-q}{p+q-p+q} \Rightarrow \left[ \frac{\theta + \sin \frac{\theta}{2}}{\cos \frac{\theta}{2}} \right]^2 = \frac{p}{q}

\Rightarrow \left[ \frac{1+\tan \frac{\theta}{2}}{1-\tan \frac{\theta}{2}} \right]^2 = \frac{p}{q} \Rightarrow \tan^2 \left( \frac{\pi}{4} + \frac{\theta}{2} \right) = \frac{p}{q} \Rightarrow \cot^2 \left( \frac{\pi}{4} + \frac{\theta}{2} \right) = \frac{q}{p}

Note: \cot \left( \frac{\pi}{4} + \frac{\theta}{2} \right) = \sqrt{\frac{q}{p}} only if \cot \left( \frac{\pi}{4} + \frac{\theta}{2} \right) > 0.
